

JobScout

Brand Kit

Built on August Health (augusthealth.com): warm cream canvas, indigo ink, an editorial serif at weight 400 against a geometric sans, pill geometry, warm-brown shadows. Reference sheet and screenshots live in [brandkit/references/august-health/](#).

Colour *and* surfaces

Cream is the ground, not white. Indigo is the single saturated action colour. Everything else is a surface or an accent, and the accents are decorative by default.

Brand

Surfaces

Accents

Surface ladder

cream canvas → white card → tinted card → accent → vibrant. Never place a colour accent directly on cream without a white card under it.

One saturated colour is the whole discipline. If a screen needs a second attention-grabbing hue, the first one is being spent in the wrong place.

Contrast, *measured*

Every figure below was measured against the cream canvas, not estimated. Two of them change the rules, and both are easy to get wrong.

TOKEN	ON CREAM	SAFE FOR
deep-ink	17.81:1	body text
midnight-violet	14.33:1	body text
stone	11.44:1	body text
meadow	7.31:1	body text
ember-deep	7.88:1	body text
indigo	4.15:1	large text and fills only
forest	3.39:1	large text and fills only
ember	3.70:1	large text and fills only
blossom	1.87:1	decorative surfaces only
lavender-mist	1.73:1	decorative surfaces only

The two that catch people

- indigo 4.15 — fills and large text only, never body copy.
- forest 3.39 — fills and large text only; use meadow for labels.
- ember, blossom and lavender-mist — decorative surfaces only, never text.
- White on forest is 4.34 and white on ember is 2.80: both fail. Use dark text on those fills, or switch to meadow or indigo when a filled pill needs white text.

Type & geometry

Serif for all headings, weight 400 only — never 500 or above. Sans for body, UI, buttons and labels at 400 and 500 only. No element takes more than two weights.

An LLM reads the job market honestly

Newsreader carries every heading at weight 400. Inter carries body, controls and labels at 400 and 500. The wordmark is the same face at opsz 72, converted to outlines.

ROLE	SIZE	LINE HEIGHT
caption	12px	1.6
body-sm	14px	1.4
body	16px	1.6
subheading	20px	1.3
heading-sm	24px	1.3
heading	32px	1.1
heading-lg	48px	1.1
display	64px	1

Radius

Interactive elements are always pills at 1600px. Cards never go below 16px. No sharp corners anywhere.

Shadow

Warm brown `rgba(75,68,57,...)` — never cool grey `rgba(0,0,0,...)`.

cta — 0 12px 24px and 0 48px 48px, both at .10 alpha.

The *mark*

A bearing rose: eight dots on a ring, sizes graduating clockwise from bearing 000, so it reads as a sweep rather than a wheel — which is the product. The mark has **no plate**. It ships in two cuts, standard and display, off one geometry.

Ring $r=11$ in a 24 box. Solid dots are the standard cut; the dashed ghosts show the mass its square cuts away.

BEARING	DOT r	IN THE STANDARD CUT
000	2.275	cropped
045	2.569	whole
090	2.864	cropped
135	3.158	whole
180	3.453	cropped
225	3.747	whole
270	4.042	cropped
315	4.336	cropped

The numbers

Radii graduate linearly, $r = 2.275 + 0.2944i$ clockwise from 000, so 000 is 2.275 and 315 is 4.336. In the standard cut the four cardinals and the largest are cropped by the square; the four intercardinals are whole. At 270 and 315 the two largest clear each other by 0.04 units — they read as touching, and that is the top of the sweep. August's own geometry is the same ring with a uniform dot r 3.865; the graduation is what makes this one ours.

The needle is gone. It survives only as [mark/jobscout-bearing-dial.svg](#) for the native apps' score element. Fit lights the bearings now — see §08.

The standard cut, *in use*

Same geometry in every cell — only the ground and the ink change. A plate appears in exactly two places, and both are launcher requirements.

PLATE-LESS — THE MARK ITSELF

On cream

The default. Indigo #4865ff on canvas.

On a white card

Second rung of the ladder. Unchanged.

Mono, one ink

Midnight-violet where indigo would compete.

40 / 28 / 20 / 15 px

The cut dots survive small; the ring never closes up.

ON DARK, AND WHERE A PLATE IS FORCED

Cream on deep-ink

The reversal. Use this on every dark surface.

Lavender on deep-ink

Quieter alternative; matches ink-card code colour.

On the divider gradient

Always on the dark side of the sweep, never the bloom.

App tile

Launchers, tabs, avatars. Plate radius 5.6/24.

NEVER

Rotate it

Bearing 000 is north. Always.

Put it on an accent

Accents need a white card under them.

Retired: indigo plate

On cream its edge disappears; the dots read as holes.

Display cut, small

Below 48px it is a ring of dots. See §06.

The display *cut*

The same eight dots with nothing cut. It exists because the standard cut hides its own best feature: with four dots cropped you cannot compare their sizes, so the graduation is implied rather than shown. Given room, the display cut shows it.

Standard

Blocky, high-contrast, and the cut edges give it a silhouette nothing else owns. Holds down to 15px.

Display

All eight whole, so the sweep is legible. Needs room, and a floor.

The rule

Display cut at 48px and above, with clear space around it — document covers, feature graphics, social cards, site heroes, pitch decks, and the fit states at card size.

Standard cut everywhere else — below the floor, inside any plate or icon, and in every lockup. Those three are not preferences; each one is a place the display cut measurably fails.

WHY THE FLOOR, AND WHY NEVER IN A LOCKUP

Below the floor

At 28px and under it is a loading spinner, not a mark.

In the lockup

The standard cut carries its weight beside Newsreader 400; uncropped reads light and the wordmark takes over.

In a plate

Padding all round, so the mark reads smaller in the same icon.

The two largest dots touch. At bearings 270 and 315 they clear by 0.041 units — 0.7px at 512, nothing at 32. The standard cut's square used to slice through them, so it never showed. The display cut owns it as the sweep closing on itself, and that collision is the real reason for the size floor.

Wordmark & *lockups*

The wordmark is Newsreader 400 at optical size 72, converted to outlines — no font file is needed to render it, and no one can accidentally set it at another weight.

JobScout

LOCKUPS — STANDARD CUT ONLY

JobScout

Horizontal

Default. Mark square = $1.15 \times$ cap height, centred on the cap band. Gap = $0.42 \times$ mark side.

JobScout

Stacked

For narrow columns and square crops. Mark square = $2.15 \times$ cap height.

CLEAR SPACE & MINIMUMS

JobScout

Clear space is half the mark side on every edge.
Nothing enters the dashed box.

Minimums

Horizontal lockup	112px wide
-------------------	------------

Stacked lockup	84px wide
----------------	-----------

Mark alone, standard	16px
----------------------	------

Mark alone, display	48px
---------------------	------

Below the lockup minimum, drop the wordmark and use the mark alone rather than shrinking both.

NEVER

JobScout

Weight it up

400 is the only weight the serif takes.

JobScout

Stretch it

Scale the lockup, never one axis.

JobScout

Swap in the display cut

Lockups take the standard cut only — uncropped, the wordmark takes over.

The fit *bands*

Fit lights the bearings in turn, clockwise from 000. The mark and the score device are the same object, which is the point of the rebuild.

Above, the display cut at card size — counting lit bearings is easier when none are cut, which is this cut's best showing. Below the floor, the same four states take the standard cut:

BAND	FIT	LABEL COLOUR	FILL	ON CREAM
● auto	≥80	#225b2c	#3e954d	7.11:1
● ping	70–79	#394981	#617ad1	7.53:1
● unsure	55–69	#713f00	#b86b03	7.58:1
● near-miss	<55	#4b4b5c	#7d7d97	7.50:1

Why the bands are semantic

The four fit bands are product logic, not decoration — `gate.verdict` depends on them. August treats accents as decorative; this is a deliberate departure. Each band carries a text colour measured at 4.5:1 or better on cream, and a decorative fill.

What gets rendered

From `mark/jobscout-icon.svg` at 16, 32, 64, 128, 180, 192, 256, 512 and 1024 px, plus a maskable 512 inside the 68% safe zone, an 800 px avatar, a 1280×640 social card and the 1024×500 Play feature graphic. Run `python3 assets.py`; never hand-edit a PNG.

What changed, and what is *no longer law*

v2.3 · 2026-09-19

- The mark now ships in two cuts. Standard stays primary. The display cut — the same eight dots uncropped — is documented in §06 for use at 48px and above with clear space.
- Three places it may not go: below the floor, inside a plate, and in a lockup. Each is a measured failure, not a taste call.
- Fit states take the display cut at card size and the standard cut below the floor.
- Geometry is unchanged — ring, box, radii and the 68% safe zone are exactly as v2.2 shipped, so the live Play icon and every rendered PNG stay valid.

The one thing the crop was hiding

At 270 and 315 the two largest dots clear by 0.041 units. Opening that to a half-unit means lowering the largest radius from 4.336 to about 4.089 — which also stops it being cropped, changing the standard cut's silhouette and invalidating the shipped Play icon. That is a v3 decision. v2.3 keeps the geometry and puts a floor on the cut that exposes the collision.

v2.2 made the plate-less mark primary and added the wordmark and lockups. v2.1 replaced the compass mark with the bearing rose. v1.0 was Apple-light on violet #7C5AFF; its five laws were withdrawn on 2026-09-10, preserved below under [law_withdrawn_2026_09_10](#).

Withdrawn (5)

Withdrawn by Ken on 2026-09-10, ahead of the August Health rebuild. Kept for the record only — they bind nothing.

1. The needle is the score. Fit 0–100 maps to a 270° sweep (–135 to +135); the band it lands on selects the route.
2. Only the needle turns. Never rotate the ring.
3. Never recolour the mark's ground — it is the only dark surface the brand owns besides dividers.
4. Bearings run in pipeline order (000/090/180/270), one per cardinal tick on the mark. Four ticks, four bearings.
5. Status colours are Apple's LIGHT-mode system set, not T BOT's dark-mode variants. Do not mix the two.

Where the tokens live

`tokens/brand.json` is the single source of truth, and now carries both cuts under `mark.cuts` with the floor as `display.min-px`. `tokens/brand.css` is generated from it — edit the JSON. This PDF is generated too, so it cannot drift from what ships.
