

Two cuts, *one geometry*

Ring $r=11$ in a 24 box, eight dots graduating $r = 2.275 + 0.2944i$ clockwise from bearing 000. The only variable is whether the mark's own square cuts them.

STANDARD CUT — THE DEFAULT, AT ANY SIZE

On cream

The default. Indigo #4865ff on canvas.

Cream on deep-ink

The reversal, for every dark surface.

Mono, one ink

Midnight-violet where indigo would compete.

App tile

Launchers, tabs, avatars. Plate radius 5.6/24.

DISPLAY CUT — 48PX AND ABOVE, WITH CLEAR SPACE

On cream

Document covers, heroes, feature graphics.

Cream on deep-ink

Dark covers and social cards.

Mono, one ink

Same rule as the standard mono cut.

On the divider gradient

Dark side of the sweep, never the bloom.

WHERE THE DISPLAY CUT MAY NOT GO

Below 48px

It becomes a ring of dots — a loading spinner, not a mark.

In a lockup

Lockups take the standard cut. Uncropped reads light beside Newsreader 400.

Inside a plate

Padding all round; the mark reads smaller in the same icon.

The two largest dots touch. At bearings 270 and 315 they clear by 0.041 units — 0.7px at 512, nothing at 32. The standard cut's square slices through them, so it never shows. The display cut owns it as the sweep closing on itself, and that collision is the real reason for the size floor.
